

ASHI certified and Level I Thermographer, Steve Mirowski and Dana Mirowski of Mirowski Inspections, LLC (MHI-LLC) . MHI uses infrared technology and provides the most advanced, accurate, and scientifically objective inspections available.

Infrared scanning: Power to see what no one else can

Most businesses could use a crystal ball these days. The next best alternative may be the one that addresses what we all wish could be eliminated: the unexpected crisis.

Since 2000, Mirowski Inspections has been answering questions most of us don't think to ask: How to avoid a major electrical or equipment failure? How to reduce energy costs by focusing precisely on the problem?

How to identify a problem before it becomes a crisis? There's no crystal ball, but there is a professional service almost as useful: thermographic scanning, using infrared photo optics available in Springfield from Mirowski Inspections.

Steve Mirowski is an ASHI-Certified Inspector and Level I Thermographer trained in both traditional inspection techniques as well as the most effective usage of cutting-edge technologies and protocols.

MHI provides the most advanced, accurate, and scientifically objective inspections available. With more than 1,000 property inspections performed, Steve's professionalism has delivered a return on investment many times over. His solid background in business, manufacturing, and infrared scanning equipment helps clients identify concerns before they become problems – detecting unusual heat in mechanical and electrical applications; by detecting moisture-related problems and insulation gaps; by identifying heat loss in hard-to-find places. Consider

these high-impact proactive solutions.

- *Reduce downtime and costly emergency repairs.*
- *Reduce preventive maintenance hours by pinpointing areas that need repair.*
- *Locate potential problems and “shake down” in electrical systems prior to plant start up.*
- *Minimize scheduled maintenance times by having spare parts to be on-hand prior to shutdown.*
- *Identify roof leak areas before they become major projects.*
- *Evaluate and verify repair work.*
- *Extend equipment life.*
- *Increase reliability of plant power distribution.*
- *Prevent accidents, personal injury and property damage.*
- *Prevent risk of fire due to electrical failure.*
- *Reduce casualty loss of equipment.*

The same advice applies to your home: Have you ever had to pay for an expensive weekend service call to replace a 39-cent part? Not every problem can be observed before it happens, but investing a little will pay you dividends on the side of the ledger you can control.

If you have ever wished you could have foreseen a problem before it cost thousands of dollars for repairs, down time, lost production and frustrated customers, do this: Call Steve and Dana Mirowski to learn how infrared technology can see what you can't. It may just be the closest you can get to a crystal ball.
